method for preserving data of a computing system comprising maintaining multiple non-overlapping snapshots of a volume of data in a data storage over a period of time; determining whether a granule of the volume requires caching prior to being overwritten; saving the granule of the volume prior to being overwritten if it needs caching to a cache associated with a current snapshot; and terminating the cache associated with the current snapshot just prior to the start of a next snapshot, thereby caching preserved data with a minimum of redundancy. In light of the foregoing, claims 8-9 and 10 of the present application are found to be patentable over the prior arts.
